Abstract

My research into this subject began in 1981 when I observed an Unidentified Flying Object in Ballarat, Victoria and realized that mankind was doing something scientifically wrong, for this craft was silent and making extremely quick flight at about 25,000 feet. My first reaction was that the moon had gone off its orbit, but later realized that it was still up there, looking innocent. My final understanding became aroused when I realized from my modelling that there was indeed something missing and this paper supports my findings in the year 2003, that show a positive connection between what science has accepted as the term: *Gravity*, to why and later, I found in 2006 that it was a ratio between the natural elements of the active Electron Mass Diameter to its Nucleus Mass Diameter and rewrote my book in 2012, titled: "Climate Change - Explained by Magnetism?".

Keywords: Gravity • Electron mass diameter • Nucleus mass diameter • Orbital • Magnetosphere • Ionosphere • Atmosphere • Climate change and carbon dioxide

Editorial

My retirement as a Sergeant Draughtsman in the RAAF, now aged 93, was a specialist aircraft draftsman, engineer, teacher and science enthusiast, and began by observing science in 1981, researching and proving my theory of climate change for over a 30-year period. In 2012, I was awarded a VIP place in the Worldwide Who's Who - Volume 3 for my work in the field of climate studies.

Brief history of research

I considered that the world was missing an important part of the climate change story, for I found that there were factors at play that travelled a similar path, impacted fossil fuel and carbon emissions. Eventually establishing proof that Climate Change is not only man-made, but also subjected to a natural change that was brought about by the new Earth's, spiraling orbital position change within the Sun's new positive Ionosphere space, for the Sun is now in a large positive magnetic switching field, and finally orbiting concluded within a new 120,000-year cyclical change. I identified significant development changes showing that the Barometric Air Pressure had locally changed the controlling activity of its new positive magnetic position in the Ionosphere that began near 15th.February 2000.

Some facts

After consideration of this missed natural change of space magnetism with the Earth, I especially made this site's relationship to the Sun's new refreshed magnetic status, within its Ionosphere.

Because of inertia, the position of Earth will slowly adapt to its new tilt location in space. The Earth might increase its spin, because of the fact that this new positive magnetic field has a greater emission influence than the negative magnetic, northern pole. Simultaneously, this interactive attraction between the Earth and the Moon, and vice-versa is within this new magnetic environment of the Sun, can be seen to account for its 650 mile shift off the Moon's normal orbit, prior from the year 2000, and the Moon's spiral orbit consequently changed from the magnetic negative to a positive magnetic Isometric atmospheric movement with a reaction between itself and the Earth having already affected the southern ocean levels with an increase rise of 61cm (2.4Feet).

This Barometric Change was the beginning of what has caused the chilly mornings, in our current winter cycle, because of the change with higher cloud conditions and with a typical high pressure system; we had a summer High of 1038 hPa, during our winter cycle. Alternatively, this is showing up because of the increased air pressure within the Southern Hemisphere, which causes these summer High Barometric Pressures, which is now in our unusual winter cycle.

Carbon Dioxide (CO₂) is a very heavy gas with an atomic weight of 44. The atmosphere we breathe has an average atomic weight of 29, so the CO₂ cannot rise above this point un-assisted; it is only shown as a high molecule with smoke or steam, because it is not being expressed by the media that it is a volcanic emission and the like. Our economy, for reasons of atomic weight of CO₂, in comparison, is shown up, because the fire departments of the world put out fires with it.

I repeat three basic points as to why we are experiencing this new Climate Change.

1. The tilt of the Earth has not yet relocated itself, in this new positive magnetic Ionosphere location in space, and this changed environment of the Sun has dramatically changed our seasons by two.
2. This change will give a reviewed positional change of the tilt of the Earth that will secure our future seasons [1-2].
3. The seasonal changes have already been answered, and the switch composition which showed how it has advanced our atmosphere by two seasons is shown.

Conclusion

I can show that Carbon Dioxide (CO₂) has had no influence whatsoever to do with this magnetic change of our Sun's new positive magnetic orbital position within the Ionosphere. For it is now proven without a doubt that the CO₂ molecule follows the rise of temperature of Earth, and this was found with the drilling of the Russian Vostok Ice Core exercise that ended in 2012, showing that over 450,000 years, CO₂ was @ 400 p/m has happened four times, is further evidence. This evidence has not been accepted by some western countries, for the introduction of the renewable exercise of making electricity from functions of wind and solar system, overwhelmed some of the world to introduce them and because the fire departments of the world put out fires with it. This also showed that there was employment and money flow to be made.

There are no dead trees or bushes along our freeways, because CO₂ exhaust systems from vehicles feed them, while we enjoy viewing the greenery. For more about this, you can read by go through the previous mini review of 2015 vol 3 Issue 1;3, article in same journal.
